HEARING LOSS 4th Edition

Robert T Sataloff and Joseph T Sataloff (eds) Taylor and Francis, 2005 ISBN 0824754352 Price £75

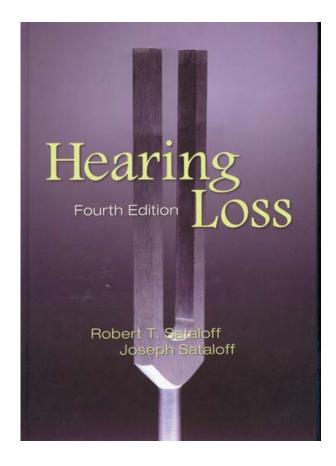

This is the fourth edition of the book, which in itself is an endorsement. It is written for a fairly broad audience and the language is extremely 'readable'. It is also aimed at those without an extensive medical vocabulary. The first few chapters review the physics of sound, ear anatomy and the physiology of hearing. The following chapters review the principles and techniques of measuring hearing for the discussion of basic audiology and more specialised hearing tests.

There are several chapters that discuss the causes of conductive and sensorineural hearing loss. These include a chapter on sudden sensorineural hearing loss and the controversies in its management. There are sections on occupational hearing loss, hearing loss in children and hearing protection devices. The final clinical section includes medical conditions such as dizziness, facial paralysis and squamous cell carcinoma of the temporal bone. There are four appendices discussing normal ear anatomy and medical conditions of the ear.

This book is written in an extremely readable form. Some of the sections on anatomy and medical conditions will be too basic for a medical graduate.

The strength of this book lies in how well it covers the basics. The sections on the physics of sound, the principles of audiology and the description of more specialised tests like evoked response audiograms and otoacoustic emissions cover the general principles very well. The applications of these tests are explained with clinical examples. The authors give an expert insight into the strengths and pitfalls of the tests.

I feel that it will be invaluable for the new breed of trainees who wish to pursue a career in ENT but have little or no exposure to the specialty. It could also be dipped into by trainees preparing for their exit

exams, or specialists wishing to brush up on a specific aspect of hearing loss or audiometric testing. As will be expected, this book has a significant North American bias, especially in the sections on occupational hearing loss.
