

The genus *Eucatops* of Costa Rica (Coleoptera: Leiodidae, Cholevinae, Eucatopini)

Stewart B. Peck,¹ Joyce Cook

Department of Biology, Carleton University, Ottawa, Ontario, Canada K1S 5B6

Abstract—The genus *Eucatops* Portevin, 1903 was previously known by 20 described species, all from South America. In this paper we describe 13 new species from Costa Rica, all in the subgenus *Eucatops*: *Eucatops (Eucatops) andersoni* sp. nov.; *E. (E.) antennatus* sp. nov.; *E. (E.) apterus* sp. nov.; *E. (E.) dentatus* sp. nov.; *E. (E.) femoratus* sp. nov.; *E. (E.) globosus* sp. nov.; *E. (E.) magnus* sp. nov.; *E. (E.) minutus* sp. nov.; *E. (E.) montanus* sp. nov.; *E. (E.) osa* sp. nov.; *E. (E.) paramontanus* sp. nov.; *E. (E.) solisi* sp. nov.; and *E. (E.) tenuisaccus* sp. nov. Some of the species are also reported from neighboring Nicaragua or Panama.

Résumé—Le genre *Eucatops* Portevin, 1903 contenait jusqu'à maintenant 20 espèces décrites, toutes d'Amérique du Sud. Nous décrivons ici 13 espèces nouvelles du Costa Rica, appartenant toutes au sous-genre *Eucatops* : *Eucatops (Eucatops) andersoni* sp. nov., *E. (E.) antennatus* sp. nov., *E. (E.) apterus* sp. nov., *E. (E.) dentatus* sp. nov., *E. (E.) femoratus* sp. nov., *E. (E.) globosus* sp. nov., *E. (E.) magnus* sp. nov., *E. (E.) minutus* sp. nov., *E. (E.) montanus* sp. nov., *E. (E.) osa* sp. nov., *E. (E.) paramontanus* sp. nov., *E. (E.) solisi* sp. nov. et *E. (E.) tenuisaccus* sp. nov. Quelques-unes des espèces sont aussi signalées des pays limitrophes, le Nicaragua ou le Panama.

[Traduit par la Rédaction]

Introduction

The genus *Eucatops* (Coleoptera: Leiodidae) was described by Portevin in 1903, with *Eucatops curvipes* Portevin, 1903, from Bolivia, as the type species. It became the type genus for the tribe Eucatopini Jeannel, 1921 and is still the only genus in the tribe. The adults are small (body length 2–7.5 mm), ovate, weakly pubescent, and with elytra striate (or rarely granulopunctate) (Fig. 1). Larvae are unknown. The beetles apparently feed as scavengers on bacteria or fungi on dung or carrion, and there are records of adults from the nests of ants (*Pheidole* Westwood and *Camponotus* Mayr in Argentina (Gnaspini 1994)) and from palm tree flowers. *Eucatops* occurs only in the Neotropical region, and several authors have described nine species in the subgenus *Eucatops* Portevin, 1903 and three species in the subgenus *Sphaerocatops* Portevin, 1907 (Peck *et al.* 1998). Salgado (2003, 2005a, 2005b) added eight species and the subgenus *Napocatops* Salgado, 2005 from Ecuador. All these species were described from localities in South America. No species have been described

from Mexico or Central America, but undescribed material has been collected in all countries in this region except Guatemala and El Salvador (Peck 2000).

The purpose of this paper is to describe the species of *Eucatops* now known from Costa Rica, as a part of the beetle species inventory project of INBio (Instituto Nacional de Biodiversidad) of Costa Rica. This is the fifth in a series of contributions on the species diversity of Leiodidae in Costa Rica (Gnaspini and Peck 1996; Peck 2003a, 2003b; Peck and Cook 2003). A summary of the known diversity of Leiodidae of Costa Rica is given by Peck and Newton (2001). The current study does not exhaust the supply of undescribed species of *Eucatops* in Costa Rica. There are additional species for which we have too few specimens to justify description.

Materials and methods

Specimens of *Eucatops* have previously been taken only rarely and mostly in baited pitfall traps and in litter sifting. The fairly recent and continued use of flight intercept traps (FITS) (Peck and Davies 1980) in moist Neotropical forests has greatly increased the number of specimens now available. This paper is based on the study of 859 specimens. The specimens

Received 4 February 2005. Accepted 4 May 2005.

(e-mail: stewart_peck@carleton.ca).

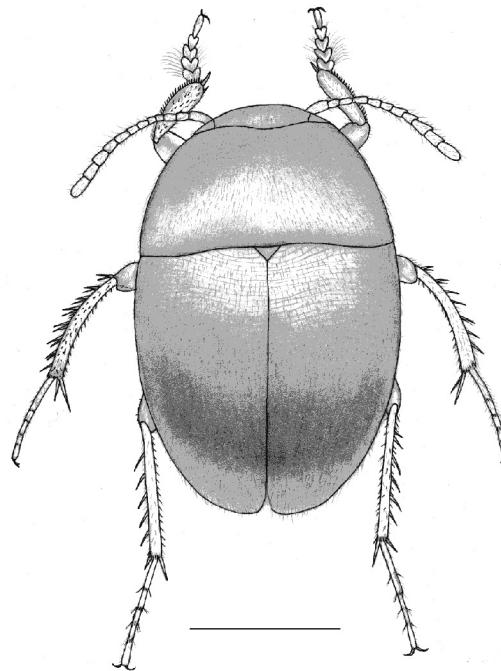

reported here were collected mostly by, and are in the collections of, the first author (SBPC; to be deposited in the Canadian Museum of Nature, Ottawa, Ontario, Canada). Additional material is from the parataxonomy collectors of the INBio program (INBio); from E.G. Riley, Department of Entomology, Texas A&M University, College Station, Texas, United States of America (TAMU); and from J.S. Ashe and collaborators of the Snow Entomology Museum, University of Kansas, Lawrence, Kansas, United States of America (SEMC).

For holotype and paratype specimens of new species, we report data as they appear on the specimen labels. We have not edited or altered these data for uniformity, but have quoted them to aid in recognition of type specimens seen by us. Other label data are summarized to obtain generalizations about distributions, field notes and habitats, and seasonality. INBio labels contain exact locality data as a set of 12 numbers in North and South Lambert coordinates.

To confirm identifications it is necessary to examine the aedeagus of male specimens and (or) the spermatheca of female specimens. For species where spermathecal shape is the best defining character, a female has been designated as holotype. The sexes are separable by the fact that males have broadly expanded basal protarsal segments. Females have all the protarsal segments unexpanded (with the same diameter). Minor males (males in which secondary sexual characters are not well developed) may be difficult or impossible to place to species. Specimens were dissected after being relaxed and removed from points or a card. Relaxing was by immersion for an hour or more in a commercial household ammonia-based window-cleaning solution. The specimen was then dissected in alcohol. The aedeagus or spermatheca was dehydrated in alcohol and placed in euparal mounting medium on a small acetate-plastic microslide. External characters were examined with a stereomicroscope at 6 \times –160 \times magnification. Outline illustrations were made from structures mounted on a microslide in euparal and photographed with a digital camera mounted on a stereomicroscope. Details were observed with a compound microscope and then added to the outline illustrations.

We have found species assignable only to the subgenus *Eucatops* in Costa Rica. The species are arranged in alphabetical order. We think it is premature at this time to propose species groups or to attempt a phylogenetic analysis of

Fig. 1. Habitus of *Eucatops* sp. from Costa Rica. Drawing by Alejandro Herrera, INBio. Scale bar = 1.0 mm.

all known species in the genus, especially in light of the expected diversity to be found in the some 3000 unstudied specimens from throughout the Neotropics now in collections, especially SBPC.

Morphology

The genus *Eucatops* possesses typical characters of the leiodid subfamily Choleviniae Kirby, 1837 (= Catopidae or Catopinae, and Leptodiridae or Leptodirinae) (Newton 1998). In addition, the following characters define the tribe Eucatopini: mesocoxal cavities narrowly separated by a prolonged mesosternal process; epistomal suture absent; all tarsi 5-segmented; head with a strongly elevated lateral occipital crest or occipital carina, which is medially weak or absent; metacoxae contiguous; maxillary palp with segment 4 much longer than segment 3, fusiform; abdominal tergum 7 not carinate; prosternum flared ventrad to form a procoxal cowling; postcoxal process of pronotum acutely triangular; outer edge of protibia with external comb of short spines; mesepisternal-epimeral suture absent; underside of elytra with microstriated area near apex;

small sclerite present behind each posterior corner of abdominal tergum 7; reflexed portion of abdominal sternum 7 produced into erect flap; abdominal spiracle 8 minute but probably non-functional; and aedeagus highly specialized (Newton 1998).

Males are characterized by having the first three segments of the protarsus broadly expanded and bordered with long setae, and the mesotarsi are not expanded. The metafemur and (or) mesofemur of what we call major males may bear teeth on the posterior margin, and the metatrochanter may bear an elongate tooth. What we call minor males are characterized as lacking these teeth, but their genitalia are identical to those of major males. The male genital segment (abdominal segment 9) is broad dorsally, usually with a median dorsal lobe at the apex, and with lateral extensions bearing setae. The morphological interpretation and terms for the unusual aedeagus were established by Jeannel (1936). The median lobe (penis) is reduced and represented by two free triangular valves (dorsal and ventral). The ventral valve is prolonged by a large, free basal piece ("basal blade" of Gaspini 1994) in the shape of a trough, which contains the internal sac. The internal sac contains large chitinized structures of complex shape. Among these pieces is a chitinized flagellum (stylet). Parameres are free, are at the sides of or dorsal to the median lobe, and bear different patterns and numbers of setae.

Females have no expanded tarsal segments. The spermatheca, a most useful species-specific structure, is of various shapes, gradually or abruptly narrowing to the thin spermathecal duct. In contrast to Salgado (2005a, 2005b), we do not illustrate the elongate and highly coiled spermathecal duct because we find that its shape is not a constant character but is variable according to how it is stretched or manipulated.

Discussion

Phylogenetic relationships

The above characters contain numerous unique conditions that isolate the tribe Eucatopini from all other Cholevinae. Jeannel associated the tribe with Ptomaphagini, based mostly on the shared presence of the distinct protibial comb, but Perreau (1989) and Gaspini (1994) questioned this relationship and concluded that this character was

convergent and not evidence of a relationship. Presently the genus seems to have more in common with Oritocatopini (with three Afrotropical genera) than any other cholevine (Newton 1998). Giachino *et al.* (1998) place Eucatopini as a sister group to Oritocatopini and these as a sister to a more basal Ptomaphagini. They interpret the geographic separation of Eucatopini and Oritocatopini as a vicariant event resulting from the Gondwana separation of Africa and South America between 150 and 120 million years ago.

Wing and eye reduction in *Eucatops*

Hind wing reduction in beetles is well known (Darlington 1943; Roff 1990; Thayer 1992) and is fairly common among Leiodidae (Peck 1973; Leschen 2000). Flightlessness has been reported previously in *Eucatops* for *E. (Sphaerocatops) brevistylus* Szymczakowski, from São Paulo, Brazil (Szymczakowski 1963). Among *Eucatops* in Costa Rica, flight wing reduction is known in only one species, *E. (Eucatops) apterus* sp. nov. *Eucatops (E.) apterus* is the only Costa Rican species known to occur above 2000 m altitude. Its occurrence in cool, wet cloud forest is consistent with the hypothesis that wing reduction is favored in stable, upper-altitude montane environments (Darlington 1943; Roff 1990).

Eye reduction is often associated with wing reduction (Thayer 1992). Among leiodids, eye reduction is commonly associated with adaptation to caves, mammal burrows, or deep litter (Peck 1973). In the high-altitude species *E. (E.) apterus*, the eyes are reduced to 6–7 facets in length. Eye reduction has not been noted previously in *Eucatops* species.

Distributional and seasonal patterns

The Costa Rican species of *Eucatops* occur in moist forests from sea level up to montane cloud forest at about 2600 m. Most of the species known to occur in Costa Rica are limited to restricted parts of the country. Lowland species are the most widespread. Upper-altitude species may be limited to a single mountain, especially if they are small-eyed or wingless species inhabiting deep litter at upper altitudes. Some species are known to have distributions that extend into either neighbouring Nicaragua or Panama. Seasonality is determined by available moisture. The species are seemingly active year-round in the permanently moist lowland

forests of the Atlantic slope. In contrast, there are no records from the dry season in the

seasonal deciduous forests of the Pacific slope of the northwestern part of the country.

Systematics

Key to the Costa Rican species of *Eucatops*

Eucatops species cannot be identified reliably without dissection of male or female genitalia. Minor males cannot be identified with this key; they are most readily identified by their association with females and (or) major males and by aedeagal characters.

- 1a. Elytra covered in granules and dense punctures not forming transverse striolae; presently known from Brazil, Bolivia, and Argentina; not known from Costa Rica . . . subgenus *Sphaerocatops* Portevin, 1907
- 1b. Elytra lacking granules, with fine dense punctures arranged in lines, either forming transverse striolae or not 2
- 2a. Body length less than 5 mm; more or less covered with fine transverse striolae over entire elytron and always visible; spermathecal complex with or without basal plate and never bifurcate when present; subgenus *Eucatops* s. str. 3
- 2b. Body length over 6 mm; transverse striolae either absent or very scattered and visible only on parts of the elytron; spermathecal complex with well-developed, bifurcate basal piece. Elytra with vaguely aligned transverse punctures, but these are not contiguous and do not form striae; apex of each elytron regularly rounded; internal spur of metatibia shorter than first article of the metatarsus; presently known only from Ecuador; not known from Costa Rica subgenus *Napocatops* Salgado, 2005
- 3a. Parameres widely separated, with apical setae only (Fig. 5) 4
- 3b. Parameres narrowly separated or approximate basally, with setae apically and on inner margins (Fig. 15) 7
- 4a. Lateral lobes of male genital segment broad (Figs. 6, 64), enclosing median dorsal lobe; spermatheca narrowing gradually to duct (Fig. 7) or U-shaped (Fig. 65) 5
- 4b. Male genital segment not as above; spermatheca an elongate sac, coiled apically (Figs. 12, 40) 6
- 5a. Major males with small tooth on posterior margin of mesofemur (Fig. 3); apex of median lobe of aedeagus acute (Fig. 5); spermatheca gradually narrowing to duct (Fig. 7). . . *E. (E.) andersoni* sp. nov.
- 5b. Major males lacking tooth on mesofemur; apex of median lobe of aedeagus rounded, with a small lobe (Fig. 63); spermatheca U-shaped (Fig. 65) *E. (E.) solisi* sp. nov.
- 6a. Apical antennal segment shorter than segments 9 + 10 (Fig. 35); large species, total length greater than 3 mm *E. (E.) magnus* sp. nov.
- 6b. Apical antennal segment longer than segments 9 + 10 (Fig. 8); small species, total length less than 3 mm. *E. (E.) antennatus* sp. nov.
- 7a. Major males with elongate, angulate metatrochanteral tooth (Figs. 20, 31) 8
- 7b. Major males with metatrochanteral tooth shorter, not angulate (Fig. 25), or absent 11
- 8a. Dorsal median lobe of male genital segment truncate (Fig. 54) *E. (E.) osa* sp. nov.
- 8b. Dorsal median lobe of male genital segment rounded (Figs. 22, 33) 9
- 9a. Spermatheca globose (Fig. 34); parameres basally separated (Fig. 32) *E. (E.) globosus* sp. nov.
- 9b. Spermatheca not globose; parameres basally approximate (Figs. 21, 68) 10
- 10a. Spermatheca strongly curved (Fig. 23) *E. (E.) dentatus* sp. nov.
- 10b. Spermatheca elongate, constricted medially (Fig. 70) *E. (E.) tenuisaccus* sp. nov.
- 11a. Total length less than 2 mm; male genital segment lacking a median dorsal lobe (Fig. 43); spermatheca globose (Fig. 44) *E. (E.) minutus* sp. nov.
- 11b. Total length greater than 2 mm; male genital segment with a median dorsal lobe; spermatheca not globose 12
- 12a. Metatrochanter of major males with a posteriorly directed tooth (Fig. 25); spermatheca weakly constricted medially, narrowing abruptly to duct (Fig. 28) *E. (E.) femoratus* sp. nov.
- 12b. Metatrochanter of major males with apical tooth minute or lacking; spermatheca reniform, gradually tapering to duct (Figs. 17, 49, 60) 13
- 13a. Flight wings atrophied, nonfunctional; eyes reduced, 6–7 facets in length *E. (E.) apterus* sp. nov.
- 13b. Flight wings fully developed, functional; eyes not reduced 14
- 14a. Spermatheca gradually narrowing to duct; duct at base following curvature of body of spermatheca (Fig. 49) *E. (E.) montanus* sp. nov.

- 14b. Spermatheca abruptly narrowing to duct; duct at base not following curvature of body of spermatheca (Fig. 60) *E. (E.) paramontanus sp. nov.*

Eucatops (Eucatops) andersoni

Peck et Cook, sp. nov.

(Figs. 2–7, 71)

Type material

Holotype male in INBio. **COSTA RICA.** **Guanacaste Province.** Cacao Biol. Sta., 1050 m, 10°55'38"N, 85°27'7"W, 10–11JUL 2000, J. Ashe, R. Brooks, Z. Falin, CR1ABFOO 097, ex flight intercept trap. **Paratypes** (10). Same data, 1, SEMC. **Alajuela Province.** Sector San Ramon de Dos Rios, 620 m, 12–13 Mar 1994 and 16 ENE–3 /FEB, F.A. Quesada and D. Garcia, L_N 318100, 381900, #2768 and #4400; 1, INBio and 1, SBPC. E.B. San Ramon, R.B. San Ramon 27 km N & 8 km W San Ramon, 810 m, 10°13'4"N, 84°35'46"W, 8 Jul 2000, S. Ashe, R. Brooks, Z. Falin, CR1ABF00 084, ex. Flight intercept trap; 1, SBPC. **Guanacaste Province.** Est. Pitilla, 700 m, 9 km S Sta. Cecilia, P. N. Guanacaste, Jul a Ago 1992, Tp Malaise, L_N 330200, 380200; 1, INBio and 2, SBPC; same locality, May 1995, P. Rios, C. Moraga, intersección, L_N 329950, 380450; 1, INBio and 1, SBPC; same locality, 10°59'22"N, 85°25'33"W, 13–15 Jul 2000, J. Ashe, R. Brooks, Z. Falin, CR1ABFOO 135, ex flight intercept trap; 1, SEMC.

Etymology

The species is named in recognition of the extraordinary collections of Leiodidae made by Robert Anderson in Costa Rica.

Diagnostic description

Total length 2.7–3.8 mm; greatest width 1.7–2.3 mm. Antenna (Fig. 2) with segment 3 longer than segment 2; club shorter than six basal segments; segment 8 wider than long; apical segment about as long as segments 9 + 10. Eyes not reduced. Metathoracic wings fully developed. Male mesofemur (Fig. 3) with a small tooth at middle of posterior margin. Male metafemur (Fig. 4) with a small tooth at middle of posterior margin. Male metatrochanter (Fig. 4) with a small tooth at apex. Aedeagus (Fig. 5) with median lobe acutely angled at apex; large sclerite of internal sac median in position, not curved. Parameres (Fig. 5) short,

widely spaced, with setose apices. Male genital segment (Fig. 6) with median dorsal lobe short, rounded apically, completely enclosed by broad lateral lobes. Spermatheca (Fig. 7) an elongate sac with a small thickening at base, gradually tapering to duct.

Eucatops (Eucatops) antennatus

Peck et Cook, sp. nov.

(Figs. 8–12, 72)

Type material

Holotype female in INBio. **COSTA RICA.** **Alajuela Province.** 38 km NW San Ramon, Reserva San Ramon, 850 m, premontane forest, 14–15.VI.97, FIT, S. & J. Peck, 97–22. **Paratypes** (2). Same data, 1 female, SBPC. Est. Biol. San Ramon, Res. Biol. San Ramon 27 km N & 8 km W San Ramon, 810 m, 10°13'4"N, 84°35'46"W, 8 Jul 2000, S. Ashe, R. Brooks, Z. Falin, CR1ABF00 084, ex. Flight intercept trap; 1 male, SEMC.

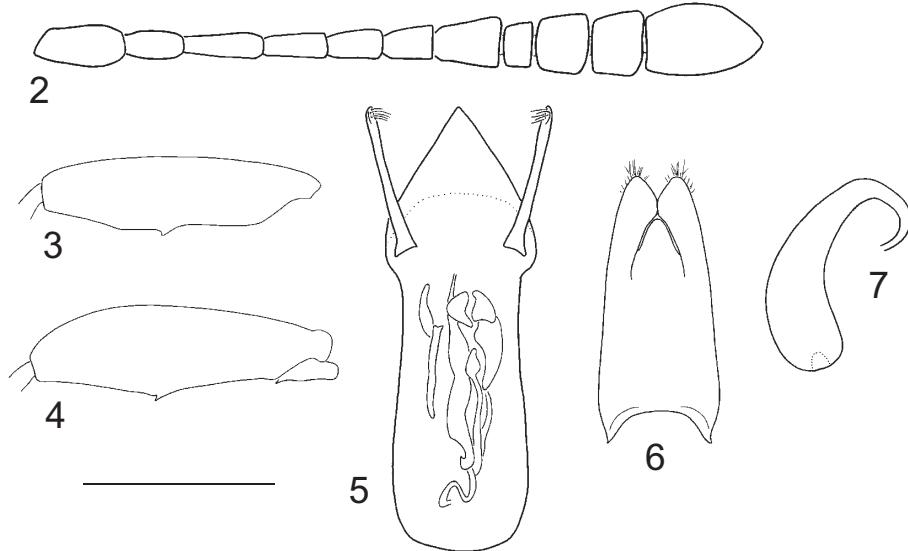

Etymology

The name *antennatus* (Latin) refers to the distinctive, elongate terminal antennal segment of this species.

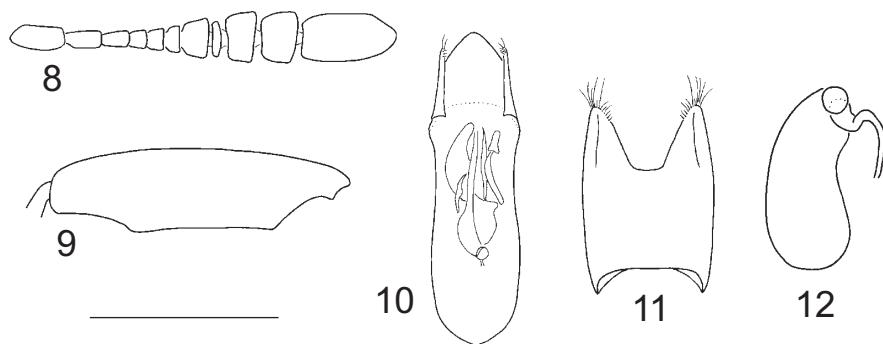

Diagnostic description

Total length 2.1–2.6 mm; greatest width 1.4–1.6 mm. Antenna (Fig. 8) with segment 3 shorter than segment 2; club longer than six basal segments; segment 8 short, more than 2 times wider than long; apical segment longer than segments 9 + 10. Eyes not reduced. Metathoracic wings fully developed. Male mesofemur (Fig. 9) obtusely angulate on apical half of posterior margin. Male metafemur and metatrochanter unmodified. Aedeagus (Fig. 10) with median lobe broad, apex rounded; large sclerite of internal sac curved to right; parameres (Fig. 10) short, widely separated basally, setose apically. Male genital segment (Fig. 11) with median dorsal lobe absent. Spermatheca (Fig. 12) an elongate reniform sac, narrow and strongly curved apically.

Figs. 2–7. *Eucatops (Eucatops) andersoni*: 2, antenna; 3, male mesofemur, ventral; 4, male metafemur and metatrochanter, ventral; 5, aedeagus, dorsal; 6, male genital segment, dorsal; 7, spermatheca. Scale bar = 0.5 mm (Figs. 2, 5), 1.0 mm (Figs. 3, 4, 6), and 0.2 mm (Fig. 7).

Figs. 8–12. *Eucatops (Eucatops) antennatus*: 8, antenna; 9, male mesofemur, ventral; 10, aedeagus, dorsal; 11, male genital segment, dorsal; 12, spermatheca. Scale bar = 0.5 mm (Figs. 8, 9), 0.4 mm (Figs. 10, 11), and 0.2 mm (Fig. 12).

***Eucatops (Eucatops) apterus* Peck et Cook, sp. nov.**

(Figs. 13–17, 71)

Type material

Holotype male in INBio. COSTA RICA. Heredia province. P.N. Braulio Carrillo, Volcan Barva, 2600 m, 10°07'30"N, 84°07'30"W, 11.VI.1997, R. Anderson, oak forest litter 97–011. Paratypes (10). Eight with same data, SBPC. San Jose Province. 4.6 km E de Villa Mills, Est. Querici, alrededor de la Estacion, 2600 m, 23 Oct–1 Nov, 1995, B. Gamboa Foso, L_S 389400, 499600 #6334; 1,

SBPC. San Jose Province. Pan American Highway, km 80.5, 9.5 km SSW, on San Gerardo Rd, Caterata Trail, 2020 m, 23 Jul 2000, J. Ashe, R. Brooks, Z. Falin, CR1ABFOO 229, ex. fogging fungus covered log; 1, SEMC.

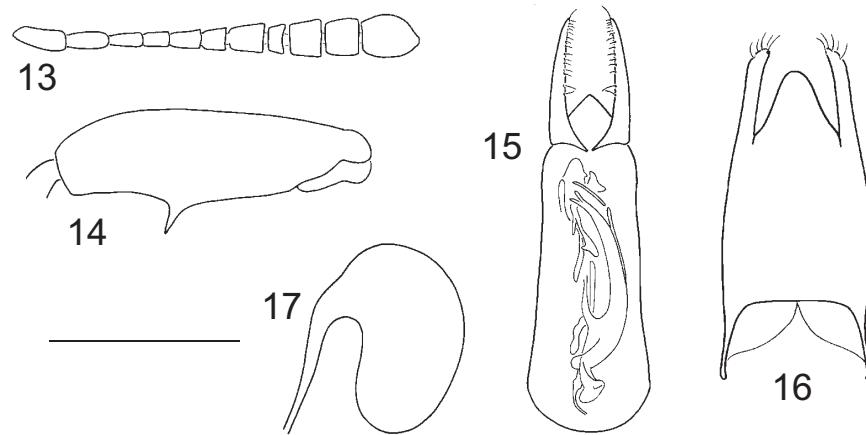

Etymology

The name *apterus*, from the Greek prefix *a* (not) and *pterum* (winged), refers to the flightlessness of this species.

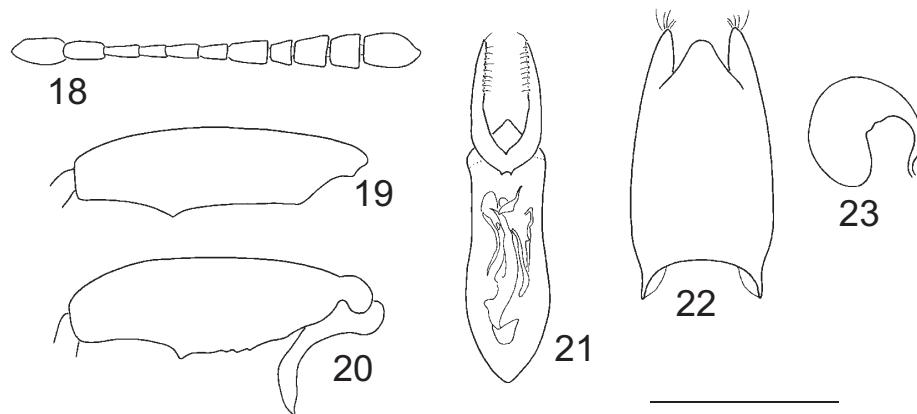

Diagnostic description

Total length 2.3–2.4 mm; greatest width 1.4–1.5 mm. Antenna (Fig. 13) with segment 3

Figs. 13–17. *Eucatops (Eucatops) apterus*: 13, antenna; 14, male metafemur and metatrochanter, ventral; 15, aedeagus, dorsal; 16, male genital segment, dorsal; 17, spermatheca. Scale bar = 0.5 mm (Figs. 13, 14), 0.4 mm (Figs. 15, 16), and 0.2 mm (Fig. 17).

Figs. 18–23. *Eucatops (Eucatops) dentatus*: 18, antenna; 19, male mesofemur, ventral; 20, male metafemur and metatrochanter, ventral; 21, aedeagus, dorsal; 22, male genital segment, dorsal; 23, spermatheca. Scale bar = 0.5 mm (Figs. 18–20), 0.4 mm (Figs. 21, 22), and 0.2 mm (Fig. 23).

slightly shorter than segment 2; club shorter than six basal segments; segment 8 wider than long; apical segment shorter than segments 9 + 10. Eyes somewhat reduced, about 6–7 facets long and 11–12 facets high. Metathoracic wings reduced, nonfunctional; length of wing about one-half length of elytron. Male mesofemur unmodified. Metafemur of major male (Fig. 14) with a narrow tooth, angled slightly apically, on apical half of posterior margin. Male metatrochanter unmodified. Aedeagus (Fig. 15) with median lobe short, broad, apex approximately right-angled; large sclerite of internal sac curved to left; parameres (Fig. 15) elongate, narrowly separated basally, setose on inner margins and apically. Male genital segment (Fig. 16) with median dorsal lobe narrow,

rounded apically. Spermatheca (Fig. 17) reniform, gradually narrowing to duct.

Etymology

The name *dentatus* is from the Latin word *dentat* (toothed) and refers to the elongate tooth on the metatrochanter of major males of this species.

Diagnostic description

Total length 2.1–2.6 mm; greatest width 1.3–1.8 mm. Antenna (Fig. 18) with segments 2 and 3 subequal in length; club shorter than six basal segments; segment 8 slightly wider than long; apical segment shorter than segments 9 + 10. Eyes not reduced. Metathoracic wings fully developed. Mesofemur of major male (Fig. 19) with tooth on apical half of posterior margin. Metafemur of major male (Fig. 20) with several small teeth at middle of posterior margin. Metatrochanter of major male (Fig. 20) with

elongate, curved tooth at apex. Aedeagus (Fig. 21) with median lobe short and broad, approximately right-angled apically; large sclerite of internal sac curved to left. Parameres (Fig. 21) elongate, approximate basally; with setae apically and on inner margins. Male genital segment (Fig. 22) with median dorsal lobe narrow and rounded apically. Spermatheca (Fig. 23) strongly curved, gradually tapering to duct.

Eucatops (Eucatops) femoratus Peck et Cook, sp. nov.

(Figs. 24–28, 73)

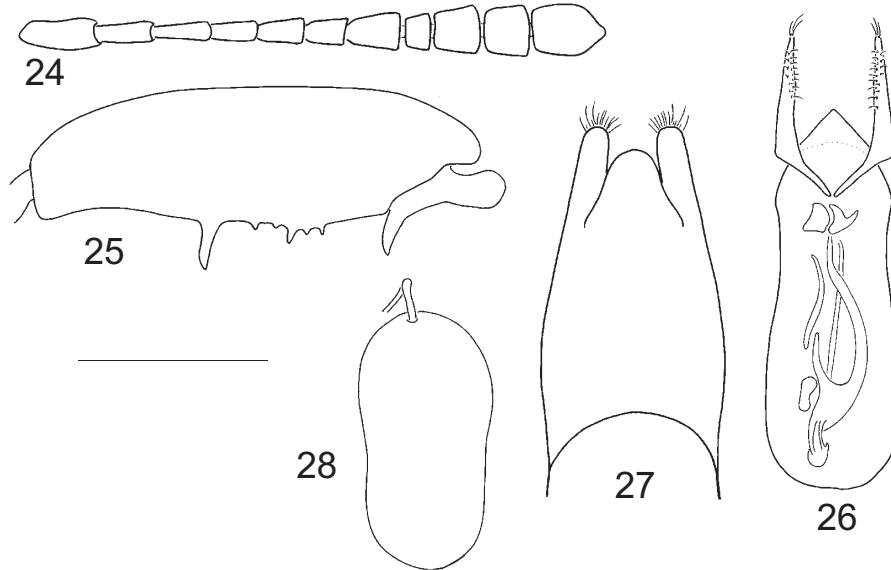

Type material

Holotype male in INBio. **COSTA RICA.** **Alajuela Province.** 38 km NW San Ramon, Reserva San Ramon, 850 m, premontane forest, 14–15.VI.1997, S. & J. Peck, 97–22. **Paratypes** (78). **Alajuela Province.** E. B. San Ramon, R. b. San Ramon, 27 km N & 8 km W San Ramon, 810 m, 10°13'4", 84°35'46"W, 8 Jul. 2000, J. Ashe, R. Brooks, Z. Etymology

The name *femoratus*, from the Latin word *femoris* (upper part of leg), refers to the multidentate metafemur of major males of this species.

Figs. 24–28. *Eucatops (Eucatops) femoratus*: 24, antenna; 25, male metafemur and metatrochanter, ventral; 26, aedeagus, dorsal; 27, male genital segment, dorsal; 28, spermatheca. Scale bar = 0.5 mm (Figs. 24, 25), 0.4 mm (Figs. 26, 27), and 0.2 mm (Fig. 28).

Diagnostic description

Total length 2.9–3.8 mm; greatest width 1.9–2.4 mm. Antenna (Fig. 24) with segments 2 and 3 subequal in length; club shorter than six basal segments; segment 8 wider than long; apical segment shorter than segments 9 + 10. Eyes not reduced. Metathoracic wings fully developed. Male mesofemur unmodified. Metafemur of major male (Fig. 25) with several teeth in middle of posterior margin. Metatrochanter of major male (Fig. 25) with tooth at apex. Aedeagus (Fig. 26) with median lobe broad, approximately right-angled at apex; large sclerite of internal sac curved to left. Parameres elongate, narrowly separated basally; with setae on inner margins, dorsally and apically. Male genital segment (Fig. 27) with dorsal median lobe short, broad, rounded apically. Spermatheca (Fig. 28) large, elongate, weakly constricted medially, abruptly narrowing to duct.

Eucatops (Eucatops) globosus Peck et Cook, sp. nov.

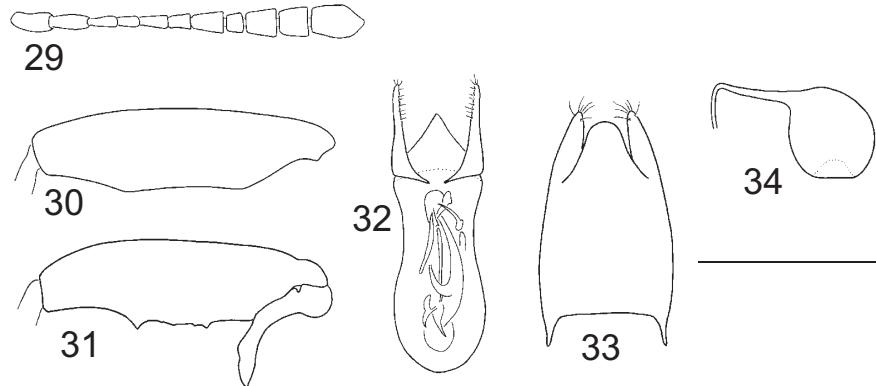

(Figs. 29–34, 74)

Type material

N18°58.6', W84°20.4', 30m, 25–31.V.2002, rainforest, 6 Fts, S. Peck, 02–09; 36, SBPC.

Etymology

The name *globosus* is from the Latin word *globo* (globe) and refers to the globose shape of the spermatheca of this species.

Diagnostic description

Total length 2.1–2.8 mm; greatest width 1.3–1.8 mm. Antenna (Fig. 29) with segment 2 slightly longer than segment 3; club shorter than six basal segments; segment 8 slightly wider than long; apical segment shorter than segments 9 + 10. Eyes not reduced. Metathoracic wings fully developed. Mesofemur of major male (Fig. 30) obtusely angulate on apical half of posterior margin. Metafemur of major male (Fig. 31) with several small teeth at middle of posterior margin. Metatrochanter of major male (Fig. 31) with an elongate tooth at apex. Aedeagus (Fig. 32) with median lobe narrowing to acute apex; large sclerite of internal sac curved to left. Parameres (Fig. 32) elongate, narrowly separated basally; with setae on inner margins and apically. Male genital segment (Fig. 33) with dorsal median lobe short, broad, rounded apically. Spermatheca (Fig. 34) globose, with a basal thickening.

Eucatops (Eucatops) magnus Peck et Cook, sp. nov.

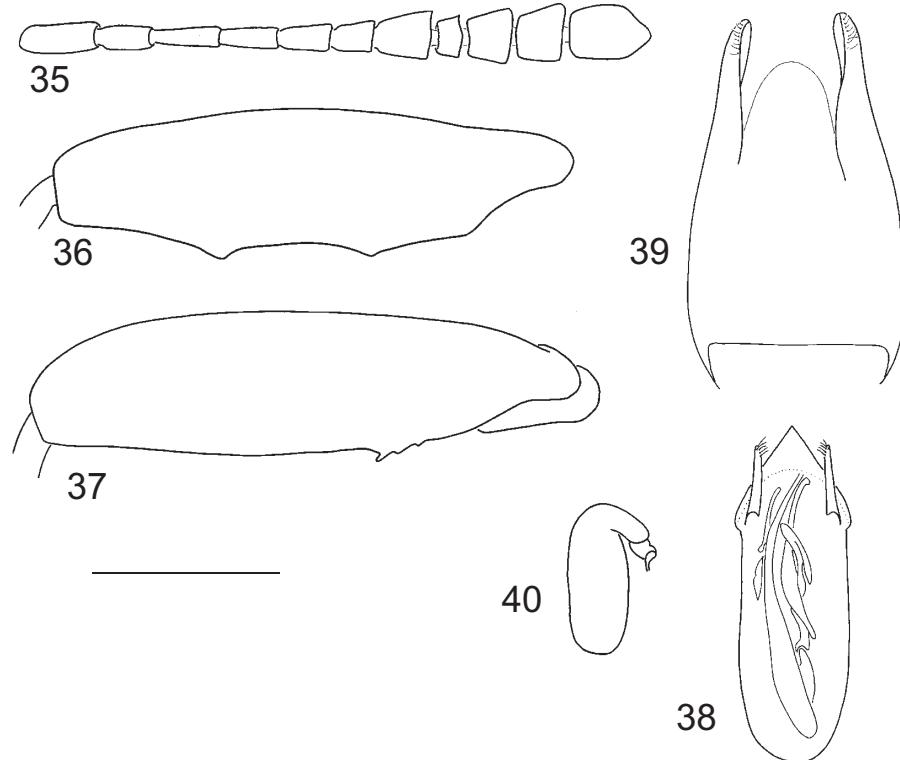

(Figs. 35–40, 75)

Type material

Etymology

The name *magnus* is from the Latin and refers to the large size of this species.

Diagnostic description

Total length 3.2–4.2 mm; greatest width 2.0–2.7 mm. Antenna (Fig. 35) with segment 3 longer than segment 2; club shorter than six basal segments; segment 8 wider than long; apical segment shorter than segments 9 + 10. Eyes not reduced. Metathoracic wings fully developed. Mesofemur of major male (Fig. 36) with two widely spaced teeth at middle of posterior margin. Metafemur of major male (Fig. 37) with a minute, apically angled tooth on basal half.

Metathoracal trochanter (Fig. 37) unmodified. Aedeagus (Fig. 38) with apex of median lobe acutely angled; large sclerite of internal sac curved to right side. Parameres (Fig. 38) short, widely separated basally, setose apically. Male genital segment (Fig. 39) with median dorsal lobe poorly sclerotized, rounded apically. Spermatheca (Fig. 40) an elongate sac, narrow and strongly coiled apically.

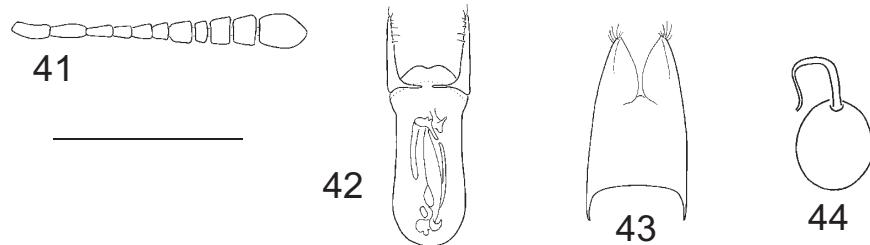

Eucatops (Eucatops) minutus Peck et Cook, sp. nov.

(Figs. 41, 44, 72)

Type material

Holotype male in INBio. **COSTA RICA.** **Puntarenas Province.** Rincon de Osa, N 8°41.141, W 83°31.117, 23–26.VI.01, 40 m, rainforest streamside FIT, S. & J. Peck, 01–15. **Paratypes** (2). Two with same data; SBPC.

Figs. 41–44. *Eucatops (Eucatops) minutus*: 41, antenna; 42, aedeagus, dorsal; 43, male genital segment, dorsal; 44, spermatheca. Scale bar = 0.5 mm (Fig. 41), 0.4 mm (Figs. 42, 43), and 0.2 mm (Fig. 44).

Etymology

The name *minutus* is from the Latin word *minut* (small) and refers to the small size of this species.

Diagnostic description

Total length 1.7–1.8 mm; greatest width 1.1–1.2 mm. Antenna (Fig. 41) with segment 2 longer than segment 3; club shorter than six basal segments; segment 8 wider than long; apical segment shorter than segments 9 + 10. Eyes not reduced. Metathoracic wings fully developed. Male mesofemur, metafemur, and metatrochanter unmodified. Aedeagus (Fig. 42) with apex of median lobe curved ventrally, appearing bilobed in dorsal view; large sclerite of internal sac curved to left side. Parameres (Fig. 42) elongate, moderately separated basally; with setae on inner margins and apically. Male genital segment (Fig. 43) with median dorsal lobe absent. Spermatheca (Fig. 44) globose, abruptly narrowing to duct.

Etymology

From *para*, close to, and *montanus*, indicating the similarity of this species to *E. (E.) montanus*.

Diagnostic description

Total length 2.1–2.9 mm; greatest width 1.3–1.8 mm. Antenna (Fig. 56) with segments 2 and 3 subequal in length; club shorter than six basal segments; length of segment 8 less than width; apical segment shorter than segments 9 + 10. Eyes not reduced. Metathoracic wings fully developed. Male mesofemur unmodified. Metafemur of major male (Fig. 57) with two small teeth near base of posterior margin and an acute, posterolaterally angled tooth distal to middle of posterior margin. Metatrochanter of major male (Fig. 57) with small apical tooth. Aedeagus (Fig. 58) with median lobe acutely angled at apex; large sclerite of internal sac curved to left side. Parameres (Fig. 58) elongate, narrow, approximate at base; with setae on apical half of inner margins. Male genital segment (Fig. 59) with median dorsal lobe variable

in width, rounded apically. Spermatheca (Fig. 60) reniform, abruptly narrowing to duct.

Eucatops (Eucatops) solisi Peck et Cook, sp. nov.

(Figs. 61–65, 73)

Type material

Holotype female in INBio. COSTA RICA.

Puntarenas Province. Est. Biol. Las Alturas, Coto Brus, 1500m, Oct 1991, M.A. Zumbado, L-S 322500, 591300. **Paratypes** (23).

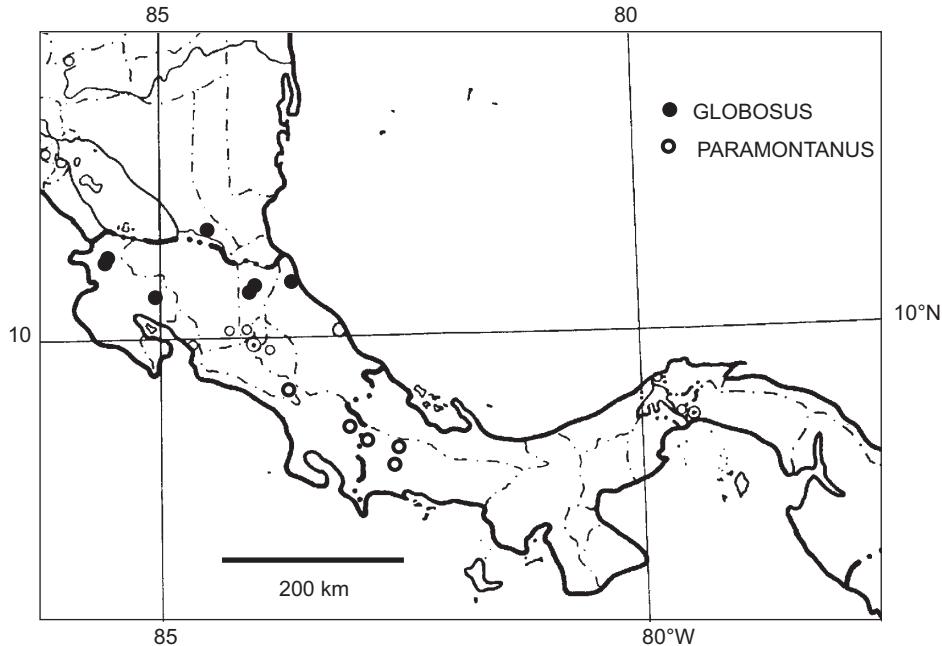

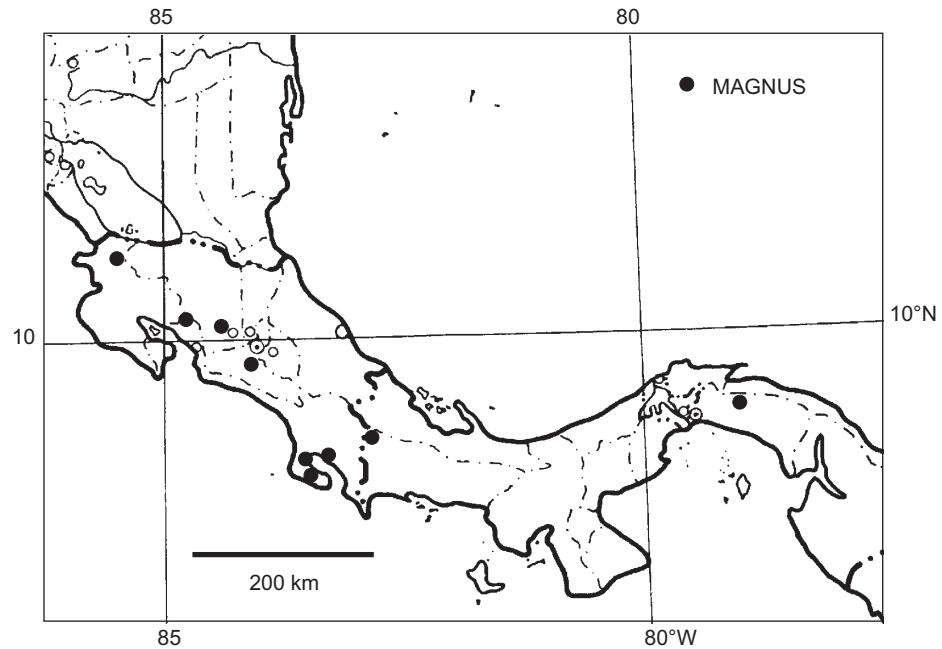

Fig. 75. Collection localities of *Eucatops (Eucatops) magnus*.

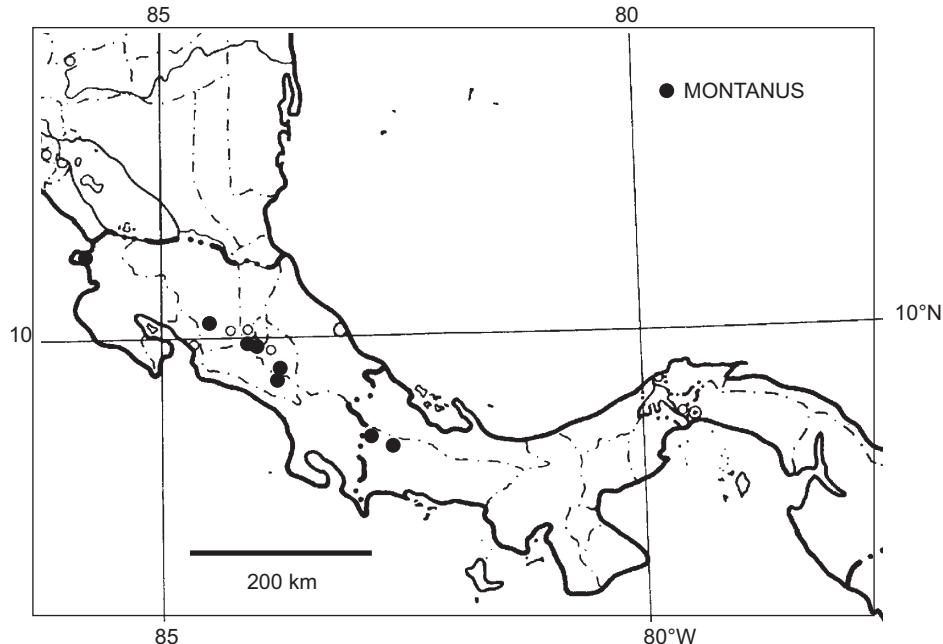

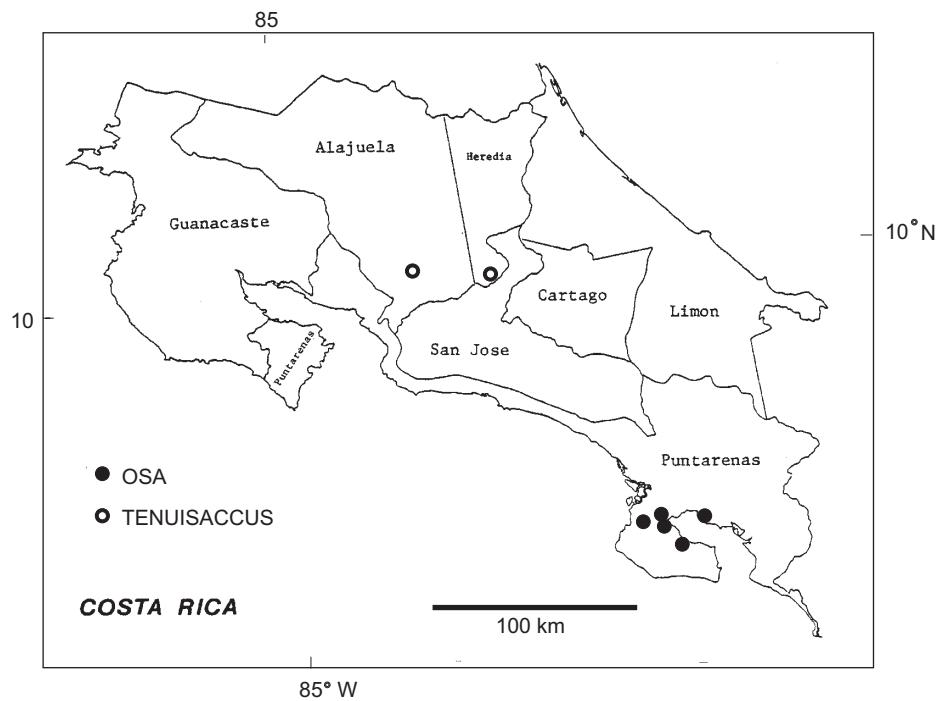

Etymology

This species is named in recognition of the extensive collecting and biodiversity research in Costa Rica of Angel Solis, INBio.

Diagnostic description

Total length 3.6–4.3 mm; greatest width 2.2–2.6 mm. Antenna (Fig. 61) with segment 3 longer than segment 2; club shorter than six basal

Fig. 76. Collection localities of *Eucatops (Eucatops) montanus*.**Fig. 77.** Collection localities of *Eucatops (Eucatops) osa* and *E. (E.) tenuisaccus*.

segments; segment 8 short, width more than twice length; apical segment shorter than segments 9 + 10. Eyes not reduced. Metathoracic wings fully developed. Male mesofemur unmodified. Metafemur of major male (Fig. 62)

with a small, apically angled tooth on apical half of posterior margin. Metatrochanter unmodified. Aedeagus (Fig. 63) with median lobe rounded and weakly lobed apically; large sclerite of internal sac median in position.

Parameres (Fig. 63) short, widely separated, with apical setae. Male genital segment (Fig. 64) with median dorsal lobe short, triangular, enclosed by basal half of lateral lobes. Spermatheca (Fig. 65) narrowly U-shaped, with a short, coiled duct.

Eucatops (Eucatops) tenuisaccus **Peck et Cook, sp. nov.**

(Figs. 66–70, 77)

Type material

Holotype female in INBio. **COSTA RICA.** **Heredia Province.** Zurqui, 1600 m, 1–9.IX.1998, C.W. O'Brien, FIT. **Paratypes** (45). Same data; 44, SBPC. **Alajuela Province.** E.B. San Ramon, R.B. San Ramon, 27 km N & 8 km W San Ramon, 08°13'30"N, 84°35'30"W, 1050 m, 15.VI.1997, R. Anderson, wet premontane forest litter, 97–015E; 1, SBPC.

Etymology

The name *tenuisaccus* is from the Latin words *tenui* (thin) and *saccus* (sac) and refers to the slender spermatheca that characterizes this species.

Diagnostic description

Total length 2.2–2.9 mm; greatest width 1.5–1.8 mm. Antenna (Fig. 66) with segment 2 longer than segment 3; club shorter than six basal segments; apical segment shorter than segments 9 + 10; segment 8 wider than long. Eyes not reduced. Metathoracic wings fully developed. Mesofemur of major male unmodified. Metafemur of major male (Fig. 67) with three small teeth at middle of posterior margin. Metatrochanter of major male (Fig. 67) with elongate, curved tooth at apex. Aedeagus (Fig. 68) with median lobe curved ventrally, apex acute; large sclerite of internal sac curved to left. Parameres (Fig. 68) elongate, narrowly separated basally; with setae on inner margins and apically. Male genital segment (Fig. 69) with median dorsal lobe broadly rounded; lateral lobes broad dorsally. Spermatheca (Fig. 70) elongate, constricted medially.

Acknowledgements

Field work in Costa Rica was partially supported by INBio and the Natural Sciences and Engineering Research Council of Canada. J. Kukalova-Peck and R. Anderson provided

excellent field assistance. W.G. Eberhard ran an FIT in the forest at his house in Escazu for the first author. A. Solis, INBio, arranged for the loan and study of INBio specimens. A. Herrera and INBio facilitated lab and field arrangements. A. Herrera of INBio provided the habitus drawing. J.S. Ashe and Z. Falin loaned material from SEMC.
