

Genetical Research

Genetical Research, founded in 1960, publishes original work on all aspects of genetics including molecular and classical genetics, plant and animal breeding, population genetics and evolutionary and developmental topics. It has consistently maintained a high international reputation for its careful editorial and refereeing policy and the quality and variety of the papers published. Critical reviews of books of potential interest are also published regularly.

Recently published papers have focussed on:

- molecular genetics of transposable elements in *Drosophila*
- molecular genetic studies in mice
- plant and animal breeding
- theoretical, population and quantitative genetics

Subscriptions 1990, Volumes 55 and 56: February, April, June, August, October and December: £104 for UK subscribers; £115 for subscribers elsewhere; airmail £21 per year extra
ISSN 0016-6723

Of Related Interest

Annals of Human Genetics

Publishes original papers and book reviews. The material published is directly concerned with human genetics or the application of scientific principles and techniques to any aspect of human inheritance. Most papers fall therefore into one of these broad categories:

- biochemical genetics
- gene mapping
- cytogenetics
- clinical genetics
- mathematical models applied to sets of family or population data.

Modelling Brain Function

The World of Attractor Neural Networks

DANIEL J. AMIT

Researchers have recently realised that there are many important parallels between the properties of statistical linear and chaotic systems in physics and neural networks. This book introduces the techniques brought from physics to the study of neural networks and the insights they have stimulated. It is written at a level accessible to the wide range of researchers working on these problems - statistical physicists, biologists, computer scientists and cognitive psychologists. The author has been careful to give a coherent and non-technical presentation of all the basic ideas.
