

## THE RECENT TREND OF MORTALITY IN THE UNITED KINGDOM

By C. D. DAYKIN AND A. P. GALLOP

### ABSTRACT

This note continues a regular series on mortality rates in the United Kingdom. Mortality experienced in each of the years 1999 to 2004 is shown by five-year age groups, and comparisons are made for broad age groups, on a standardised basis, with mortality in earlier years.

### KEYWORD

Mortality

### CONTACT ADDRESS

A. P. Gallop, Government Actuary's Department, Finlaison House, 15-17 Furnival Street, London EC4A 1AB, U.K. E-mail: adrian.gallop@gad.gov.uk

This note continues a series on mortality rates in the United Kingdom; the previous note in the series appeared in *B.A.J.* **6**, 861-871, and dealt with mortality in the years 1994 to 1998.

The note presents details of the mortality experience of each of the years 1999 to 2004, together with a comparison with earlier years. The rates have been calculated using the deaths recorded as occurring in the U.K. each year and the resident population at 30 June of each year, as estimated by the Registrars General of England and Wales, Scotland, and Northern Ireland.

Table 1 shows central death rates for the U.K. for 1999, 2000, 2001, 2002, 2003 and 2004, together with the ratios of these rates to the corresponding average rates for 2000 to 2002. To minimise the effect of changes in the age distribution of the population exposed-to-risk, the death rates for age groups have been calculated, and the comparisons with the 2000 to 2002 mortality rates have been made, by standardising by individual ages on the age distribution of the estimated U.K. population on 30 June 2001, which take account of the various revisions made to the 2001 Census data. The death rates given in the previous article were standardised using the distribution of the estimated U.K. population on 30 June 1991.

Comparisons have also been made with the period since 1971. Tables 2 and 3 show, respectively, the death rates and the ratios to the 2000 to 2002 standard by six age groups: under age 1 (infants), 1-14 (children), 15-44 (younger adults), 45-64 (the middle aged), 65-79 (the younger elderly) and 80 and over (the elderly). The ratios of standardised group death rates to the 2000 to 2002 standard are shown graphically in Figures 1 and 2 for these

broad age groups. Since the previous article was prepared, there have been revisions to the population estimates for the U.K. for years since 1981, and these have been incorporated in the calculations of the death rates shown in the tables. Hence, in some cases, the single age death rates used in the current article may differ from those given in previous articles. The death rates by age groups will differ anyway from the rates previously published, because of different standardisations.

The trend in all-age standardised mortality for both males and females has been downwards since 1971, although there have been some years when mortality increased over the previous year for both males and females (1972, 1976, 1978, 1985, 1993 and 1995). In addition, mortality rose for females in 1989, 1999 and 2003. Mortality in 2004 was some 44% lower for males, and 35% lower for females, than in 1971. Compared to 1981, male mortality in 2004 was 38% lower and female mortality 28% lower. In the most recent years, overall male mortality fell by 3% in 2001, 1.5% in 2002, 1.6% in 2003 and 5.6% in 2004. Overall female mortality fell by 1.8% in 2001, was stationary in 2002, rose by 0.6% in 2003, and fell by 6.1% in 2004. The age groups showing the lowest declines in mortality over the period 1981 to 2004 for men were 30 to 34, for whom mortality has actually increased slightly, and for women 25 to 29 (and also 90 and over). For the younger ages, this is due mainly to the general declines in mortality from other causes being offset by increases in the numbers of suicides and deaths related to HIV infection and AIDS.

Comparing the most recent three years with the earliest three years in Tables 2 and 3, i.e. 2002 to 2004 with 1971 to 1973, the average level of mortality fell by 42% for males and 34% for females. Infant mortality fell by around 70% between these two periods, and the mortality of children between one and 14 years old fell by around 65%. At ages 15-44 the fall was 25% for men and 37% for women, and at 45-64 the fall was 50% for men and 41% for women. At ages 65-79 the fall was 47% for men and 38% for women, while at 80 and over it was around 31% for men and 29% for women.

#### HISTORICAL DATA AND LIFE TABLES

As well as the data provided in these articles, a series of historical life tables (known as Interim Life Tables) for the U.K. (and constituent countries) based on population estimates and deaths data for three consecutive calendar year periods for years 1980 to 1982 onwards are available on the Government Actuary's Department (GAD) website at [http://www.gad.gov.uk/Life\\_Tables/Interim\\_life\\_tables.htm](http://www.gad.gov.uk/Life_Tables/Interim_life_tables.htm) and on the website of the Office for National Statistics at <http://www.statistics.gov.uk/STATBASE/Product.asp?vlnk=14459&Pos=&ColRank=1&Rank=222>.

These life tables show mortality rates and period life expectancies by single years of age up to age 99.

A database of estimated historical mortality rates for England and Wales, giving estimated mortality rates by single year of age back to 1841, is also available for research purposes on request from the GAD.
