Cover photo. Crustose lichens on a quartzite boulder at Mount Edith Cavell, Jasper National Park, Alberta, Canada. The large green-black lichen may be a composite thallus and it does not closely resemble many Rhizocarpons seen elsewhere on the moraine. Would users of lichenometry measure this thallus and refer to it as Rhizocarpon geographicum agg.? Photo: Daniel P. McCarthy (See the article by Osborn et al., pages 1 – 12, in this issue.)
